Network security group security rules are evaluated by priority using the combination of source, source port, destination, destination port, and protocol to allow or deny the traffic. A security rule with the same priority and direction as an existing rule. You can't delete default security rules, but you can override them with rules that have a higher priority. [Learn more](#)

The frontend IP address configuration of a load balancer serves as the entry point for incoming traffic to the load balancer, and the load balancer then distributes the traffic to the backend pool of virtual machines or services. [Learn more](#)

The backend pool is a critical component of the load balancer. The backend pool defines the group of resources that will serve traffic for a given load-balancing rule. Learn more.

Health probe is used to detect the endpoint status. The configuration of the health probe and probe responses determines which backend pool instances will receive new connections. Use health probes to detect the failure of an application and for flow control to manage load or planned downtime. [Learn more.](#)

A load balancer rule is used to define how incoming traffic is distributed to all the instances within the backend pool. A load balancing rule maps a given frontend IP configuration and port to multiple backend IP addresses and ports. An example would be a rule created on port 80 to load balance web traffic. [Learn more.](#)
